

SupplySight – ED Supply & Patient Tracking Tool (MVP Overview)

Summary

SupplySight is a lightweight tracking tool designed for Emergency Departments. It records daily patient counts and basic supply levels once per shift, then automatically generates a 7-day summary to identify usage trends, low-stock risks, and ordering recommendations. The goal is to save nurses time and help hospitals avoid both shortages and overbuying.

Problem

EDs frequently struggle with supply shortages and overstocking. Par levels are often based on habit rather than real usage. Nurses waste time hunting for missing supplies, and hospitals waste money ordering too much or too little. There is currently no simple way to link patient volume with supply consumption.

How It Works

Charge nurse or unit secretary enters the total number of patients per shift or per day. Charge nurse or supply tech performs a quick supply fullness check (Full, $\frac{3}{4}$, Half, $\frac{1}{4}$, Empty). SupplySight converts these readings into estimated end-of-shift quantities and calculates usage automatically, with no per-patient logging.

Key Outputs

- Daily usage estimates for each key supply
- Low-stock alerts based on reorder thresholds
- 7-day patient volume trends
- Supply usage per patient and per shift
- Data-driven recommendations to adjust par levels
- Clear insights to reduce waste and prevent shortages

Why It's Easy to Pilot

- No EHR integration required
- No patient names or PHI collected
- No IT involvement needed
- Runs on any phone or computer as a simple web app
- Minimal staff effort (1–2 minutes per shift)
- Perfect for a 2–4 week ED-only pilot

Goal

To save nurses time, reduce supply waste, prevent shortages, and give hospitals the real data they need to order the right amount of supplies every week.
